

Retell AI + n8n Loom Recording Check Report

Review summary based on the Loom screen recording provided for the Acme Corp Customer Support Voice Agent.

1. What Is Working

- Retell is successfully reaching the verify_identity webhook.
- The verify_identity tool call is being triggered from the Retell agent.
- The Retell endpoint connection is therefore working at the integration level.

2. Main Issue Found

The verify_identity webhook returns an unsuccessful verification result instead of matching the seeded customer.

Field	Observed / Expected
verified	false (observed)
customer_id	Empty string (observed)
Expected customer	John Smith
Expected account reference	ACME-9012

3. Impact on the End-to-End Test

Because identity verification fails, the agent does not reliably proceed to the create_ticket stage. The later customer issue may therefore fall back to general knowledge-base behavior instead of creating a ticket.

4. Recommended Next Action

Open the n8n verify-identity workflow and check the mock/seeded customer data and matching logic. Make sure the exact test identity below is present and accepted:

Name: John Smith

Account Reference: ACME-9012

Expected: verified = true

5. Retell Configuration Status

The recording indicates that the Retell-to-n8n endpoint connection is not the primary problem. The immediate issue is the verification result returned by the n8n workflow.

6. Next Test Sequence

- Verify John Smith / ACME-9012 exists in the n8n mock identity data.
- Test verify_identity directly in n8n/Postman and confirm verified=true and a customer_id.
- Only after that, continue the Retell end-to-end test.
- Then validate create_ticket and escalate_to_human request parameters.
